

PROJECT OTM

Company details	DHL Supply Chain, Site Bommel (Assa Abloy operation)		
Start	02-09-2026	Completion	31-10-2026

Project description	
DHL Supply Chain is the world's largest logistics service provider offering a full range of solutions for transport, warehousing, e-commerce and several other areas. In Tiel, DHL Supply Chain was running warehouse operations for 4 different clients. The warehouse has recently been relocated to a new site. The move happened under a lot of time pressure, which is why the Operations Manager believes that the current warehouse design is not optimal. Therefore, your challenge is to come up with a warehouse design of your own, potentially provide a more efficient and effective design than the current one. The design is pivotal in operations performance, as design choices regarding for example the layout, storage concept, zones and equipment have a big impact on performance. Your task is to develop a design of the site based on a thorough analysis of the data from the customer Assa Abloy. In your deliverables, you outline the expected performance using your design.	

Project scope / conditions	
• The project targets the receiving, storage, picking and shipping process. • The project adopts a end-to-end view, choices across the 4 processes must be aligned. • Facility design is out of scope. • Legal aspects (fire safety, compliance) should be considered.	

Company input	
• Data & information about SKU's, volume and inventory from Assa Abloy. • Information (size and limitations) about the new site: footprint can be max. 7.000m2 with a height of 12,2m.	

Project deliverables	
1. Analysis of the data provided, pre-selection and justification of policies. → 16-09-2026 2. Proposed future state for the processes in scope. → 07-10-2026 3. Performance overview including financial analysis. → 21-10-2026 Details per deliverable can be found on the next page.	

Details per deliverable

1. Analysis

- Use the data provided to determine design requirements. Determine:
 - o SKU's and pallets to be stored
 - o Orders to be processed
 - o Volume to be stored / processed (total & per SKU)
 - o Delivery lead time (time between order received and sent)
 - o Pallet weights / dimensions
 - o Picking requirements (full pallets, cases, eaches)
 - o Order profile (lines per orders, units per line, lines per pick etc.)
 - o Peak activity levels
 - o ... and more
- Identify and select potential warehouse design choices (racking, setup, automation, etc.).
- Define and substantiate the most suitable policies to execute processes.
 - o Batching, zoning, routing, putaway, slotting, sorting and more...
- Identify and select necessary equipment for executing (MHE, scanners, ec.)
- Align all the above.

Due date: 16-09-2026

2. Future state.

- Define the process steps (what is needed to fulfil according to customer agreement, how to work in the system as defined in step 1).
- Create flowcharts to illustrate the process. Clearly show where and how your design choices from step 1 are implemented.
- Propose a lay-out and zoning (3-dimensional) to match the defined process requirements.
 - o The lay-out proves it can fulfil the design requirements
- Propose a capacity plan considering the design choices made (what is for example the expected productivity?).
 - o Quantify required labor and equipment

Due date: 07-10-2026

3. Performance overview

- Identify suitable KPI's for evaluating the design and performance of the operation
 - o Show expected performance for each KPI based on your design.
- Convert the capacity plan into expected operating costs
 - o List CAPEX & OPEX
- Finalize all supporting documents (calculations, report, etc.). These contain details about deliverable 1 & 2 where your choices are justified and supported by sources.

Due date: 21-10-2026
